

## ***Active Physics* and the California Science Content Standards**

The California Science Content Standards for high school physics address the four major topics of what has become known as “classical” physics: motion and forces, energy and momentum conservation, waves, and electromagnetic phenomena. Except for topics requiring mathematical sophistication not normally expected of entering high school students (such as a facility with vectors), most of these topics are addressed in a variety of ways by the six *Active Physics* modules. The motion and force topics are addressed by the “Sports” module and the last two chapters of “Predictions,” with the most complete coverage being provided by the three “Sports” chapters coupled with the third “Predictions” chapter. In dealing with conservation of energy and momentum, the “Sports” chapters once again provide the best coverage, particularly in dealing with potential and kinetic energy. The three “Communication” chapters provide the best coverage of waves, though once again the third “Predictions” chapter helps by bringing in aspects of wave motion as well as the fundamental forces of nature. One of those fundamental forces is magnetism, which is also dealt with in greater detail (particularly its interaction with electricity) in the second “Communication” chapter and the third “Home” chapter. Basic electric circuits are the focus of the second “Home” chapter.

## ***Active Physics* and “Investigation and Experimentation”**

The most unique aspect of *Active Physics* is the way it is taught, and this lends itself especially well to the “Investigation and Experimentation” aspects of the California Standards. Through the use of computer spreadsheets and CBL probes with graphing calculators, students are acquainted with a variety of technologies used to measure and analyze data; and teacher tabulation of data from all the lab groups in a class allows for consideration of inconsistencies and attempts to explain them—as a way to develop models and theories. The Chapter Challenges of *Active Physics* require students to experience phenomena from more than one area of science and to bring these experiences to bear on solving a problem that has relevance to their everyday world.

| a. how to predict the voltage or current in simple direct current electric circuits  |               |      |      |      | *    |      |             |      |      |        |      |      | *                                 |
| b. how to solve problems involving Ohm's law   |               |      |      |      | *    |      |             |      |      |        |      |      | *                                 |
| c. any resistive element in a DC circuit dissipates energy which heats the resistor, can calculate the power in any resistive circuit element  |               |      |      |      | *    |      |             |      |      |        |      |      | *                                 |
| d. the properties of transistors and their role in electric circuits   |               |      |      |      |      |      |             |      |      |        |      |      | *                                 |
| e. charged particles are sources of electric fields and experience forces due to the electric fields from other charges  |               |      |      |      |      | *    |             |      |      |        |      |      | *                                 |
| f. magnetic materials and electric currents are sources of magnetic fields and experience forces due to magnetic fields from other sources   |               | *    |      |      |      | *    |             |      |      |        |      |      | *                                 |
| g. how to determine the direction of a magnetic field produced by a current flowing in a wire  |               | *    |      |      |      | *    |             |      |      |        |      |      | *                                 |
| h. changing magnetic fields produce electric fields, thereby inducing currents in nearby conductors  |               |      |      |      |      |      |             |      |      |        |      |      | *                                 |
| i. plasmas contain ions and/or free electrons and conduct electricity  |               |      |      |      |      |      |             |      |      |        |      |      | *                                 |
| j. electric and magnetic fields contain energy and act as vector force fields  |               |      |      |      |      |      |             |      |      |        |      |      | *                                 |
| k. the force on a charged particle $q$ is $qE$ , where $E$ is the electric field at the position of the particle   |               |      |      |      |      |      |             |      |      |        |      |      | *                                 |
| l. how to calculate the electric field resulting from a point charge   |               |      |      |      |      |      |             |      |      |        |      |      | *                                 |
| m. static electric fields have as their source some arrangement of electric charges  |               |      |      |      |      |      |             |      |      |        |      |      | *                                 |
| n. the force on a moving particle (with charge $q$ ) with speed $v$ in a magnetic field $B$ is $qvB \sin(a)$ , where $a$ is the angle between $B$ and $v$ , with the force direction determined by the right hand rule |               |      |      |      |      |      |             |      |      |        |      |      | *                                 |
| o. how to apply the concepts of electrical and gravitational potential energy to solve problems involving energy conservation  |               |      |      |      |      |      |             |      |      |        |      |      | *                                 |
